MSTD-012 Momentum[®] Serial Tophat Effective: 23 March, 2004

Introduction

The Momentum[®] Serial Tophat (MST) provides a serial communications adapter for Modicon Momentum I/O bases. The MSTD-012 allows I/O to be easily added to existing multidrop or point-to-point Modbus networks.

The MSTD-012 communicates Modbus ASCII protocol at 9600 baud with 7 data bits and even parity or 8 data bits and no parity.

The MSTD-012 is powered by the Momentum base. LED indicators show the state of POWER, Serial TX and RX. The green POWER LED should be on if the MSTD-012 is properly powered by the base. The POWER light will flash slowly if the unit is set to slave address 0. The yellow TX light is on while the MSTD-012 is transmitting data while the RX light indicates data arriving at the MSTD-012.

MSTD-012 Configuration

The MSTD-012 is configured through a 6 position DIP switch on its front. Switches 1, 2, 3, 4, and 5 control Slave Address while switch 6 sets the parity and data bits.

NOTE: The MSTD-012 only reads the DIP switches on power-up. Power must be cycled after changing the Parity or Slave Address.

1 = ON (left), 0 = OFF (right)

Figure 2 displays the DIP switch settings for a MSTD-012 set for Slave Address 13 and EVEN parity. From 1 to 6, the settings are 011011.

1 = ON (up), 0 = OFF (down)

NOTE: Power must be cycled after changing the Parity or Slave Address for the change to take effect.

Network Connection

The MSTD-012 has an RJ45 4-wire connection. The pinout is shown in Figure 3.

Register List

The Modbus models mimic the standard Modicon Ethernet Communication Adapter with some additional register support. The Output registers are zeroed on power-up and when the watchdog expires between write messages. The Watchdog register value is written to EEPROM for permanent setting. Setting the slave address to 0 returns the watchdog to factory default.
